

Ex2 – OOP course, Ariel University – Benchmark #1:

This simple benchmark allows you to test Ex2 Algorithms, the bench mark includes 3 short drives with wifi + GPS logging using the WiGLE app – two mobile phones where used. The logs were combined into a file named _comb.csv – in Ex0 / Ex1 format (6+4*x [0<x<=10] field per record – line).

Two out of three drives are almost identical and the third one is some what different (due to some traffic). Test your self using the 7 log files (2 from each drive – one from each device and ye another file for testing). Try to approximate the expected position error in each WiFi APs.

An example of the short drive perform 3 times using 2 different devices.
